Database Replication In SQL Server

By:
*Letera Tesfaye. & Leta
Lijalem.*

Database Replication?

- **Database replication** is the frequent electronic copying data from a **database** in one computer to a **database** in another.
- And then synchronizing between databases to maintain consistency.
- The result is a distributed **database** in which users can access data relevant to their tasks without interfering with the work of others

Why Replication?

- Load Balancing
- Scalability
- Fault tolerance
- Reliability
- Fast response
- To allow sites work independently

A hand holding a glowing blue globe with a city skyline in the background. The globe is held in the palm of a hand, and the city skyline is visible in the background. The title 'Replication Scenarios' is written in white text on a blue background.

Replication Scenarios

- Replication scenarios can be divided into two broad categories:
 - ✓ replicating data in a server to server environment(implemented using transactional replication, sometimes snapshot replication) and
 - ✓ Replicating data between server and clients(implemented using merge replication).

Methods of replication ?

- Microsoft SQL Server offers three types of replication
 1. Snapshot replication
 2. Transactional replication
 3. Merge replication

1. Snapshot Replication?

- Snapshot replication is used when the following scenarios is true.
 - ✓ Data changes infrequently.
 - ✓ It is acceptable to have copies of data that are out of date with respect to the Publisher for a period of time
 - ✓ Replicating small volumes of data.
 - ✓ A large volume of changes occurs over a short period of time.
- **Example:** if a sales organization maintains a product price list and the prices are all updated at the same time once or twice each year, replicating the entire snapshot of data after it has changed is recommended.

2. Merge Replication?

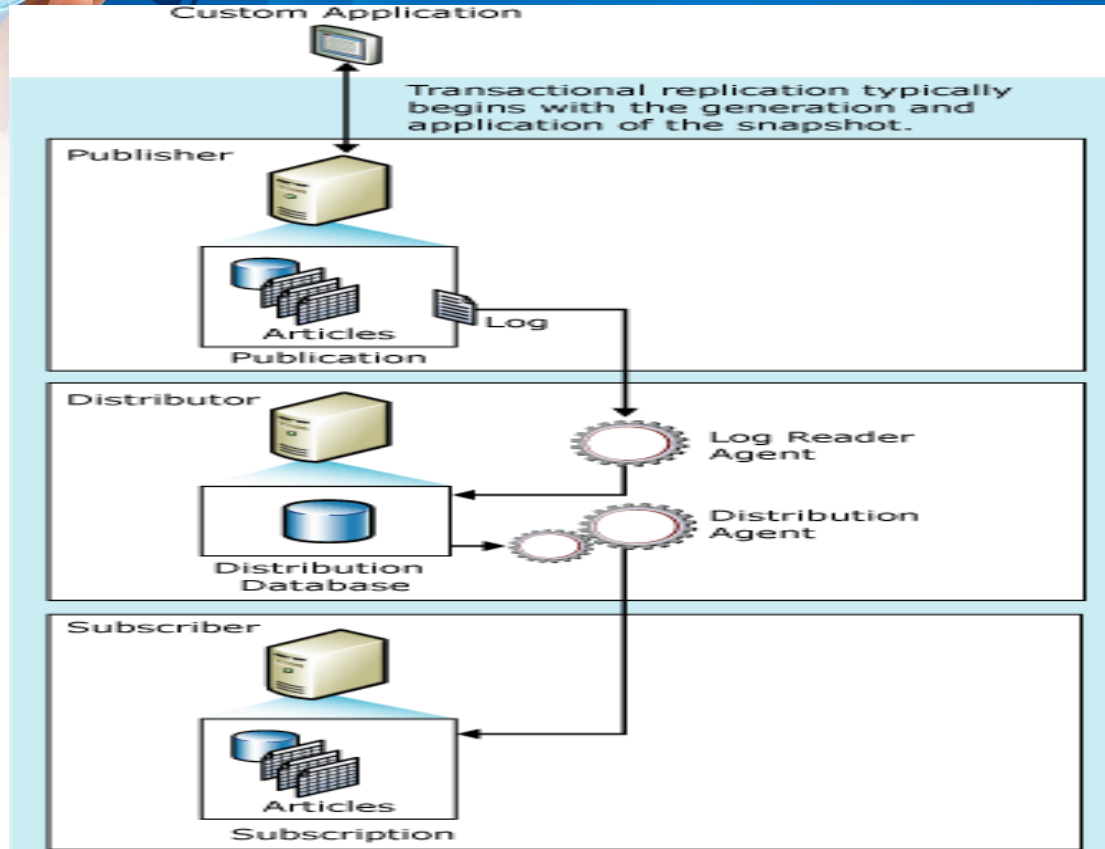

- Merge replication is typically used in server-to-client environments.
- Merge replication is appropriate in any of the following situations:
 - ✓ A Multiple Subscribers might update the same data at various times and propagate those changes to the Publisher and to other Subscribers.
 - ✓ Subscribers need to receive data, make changes offline, and later synchronize changes with the Publisher and other Subscribers
 - ✓ Each Subscriber requires a different partition of data.
- **Example:** Merge replication is commonly used by laptop and other mobile users who cannot be constantly connected to the publisher, but still need to carry around a copy of the database that they can make changes to.

3. Transactional Replication?

- **Transactional replication** is typically used in **server-to-server environments** and is appropriate in each of the following cases.
 - ✓ You want **incremental changes** to be propagated to Subscribers as they occur.
 - ✓ The application requires access to intermediate data states
 - ✓ The Publisher has a very high volume of insert, update, and delete activity.
 - ✓ The Publisher or Subscriber is a **non-SQL Server database**, such as Oracle.
- **Example:** So to the best of our knowledge we have selected the transactional replication because **incremental changes** on the transaction must be **propagated to the subscribers** simultaneously in order keep **consistency** among bank data's.

How Transactional Replication Works in SQL Server ?

Cont..d

- 1. Distributer** The Distributor is a database instance that acts as a store for replication specific data associated with one or more Publishers.
- 2. Publisher:** maintains the original copy of the data or where the replication originates.
- 3. Articles** An **article** can be a **database** object, such as a table or a stored procedure, or a selection of table columns and rows
- 4. Subscriber** receives the articles from a publisher. It can subscribe to one or more publication

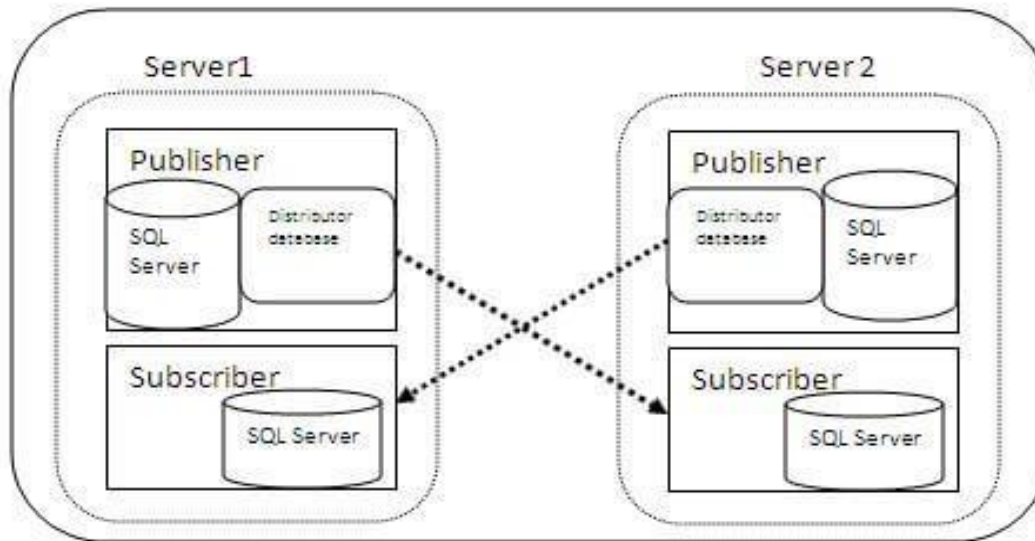

Prerequisites for Transactional Replication

- **Primary Key:** This is a basic rule that every article should have a Primary Key to be a candidate table for Transactional Replication.
- **Securing Snapshot folder**
- **Network Bandwidth**
- **Enough disk space for database being published**

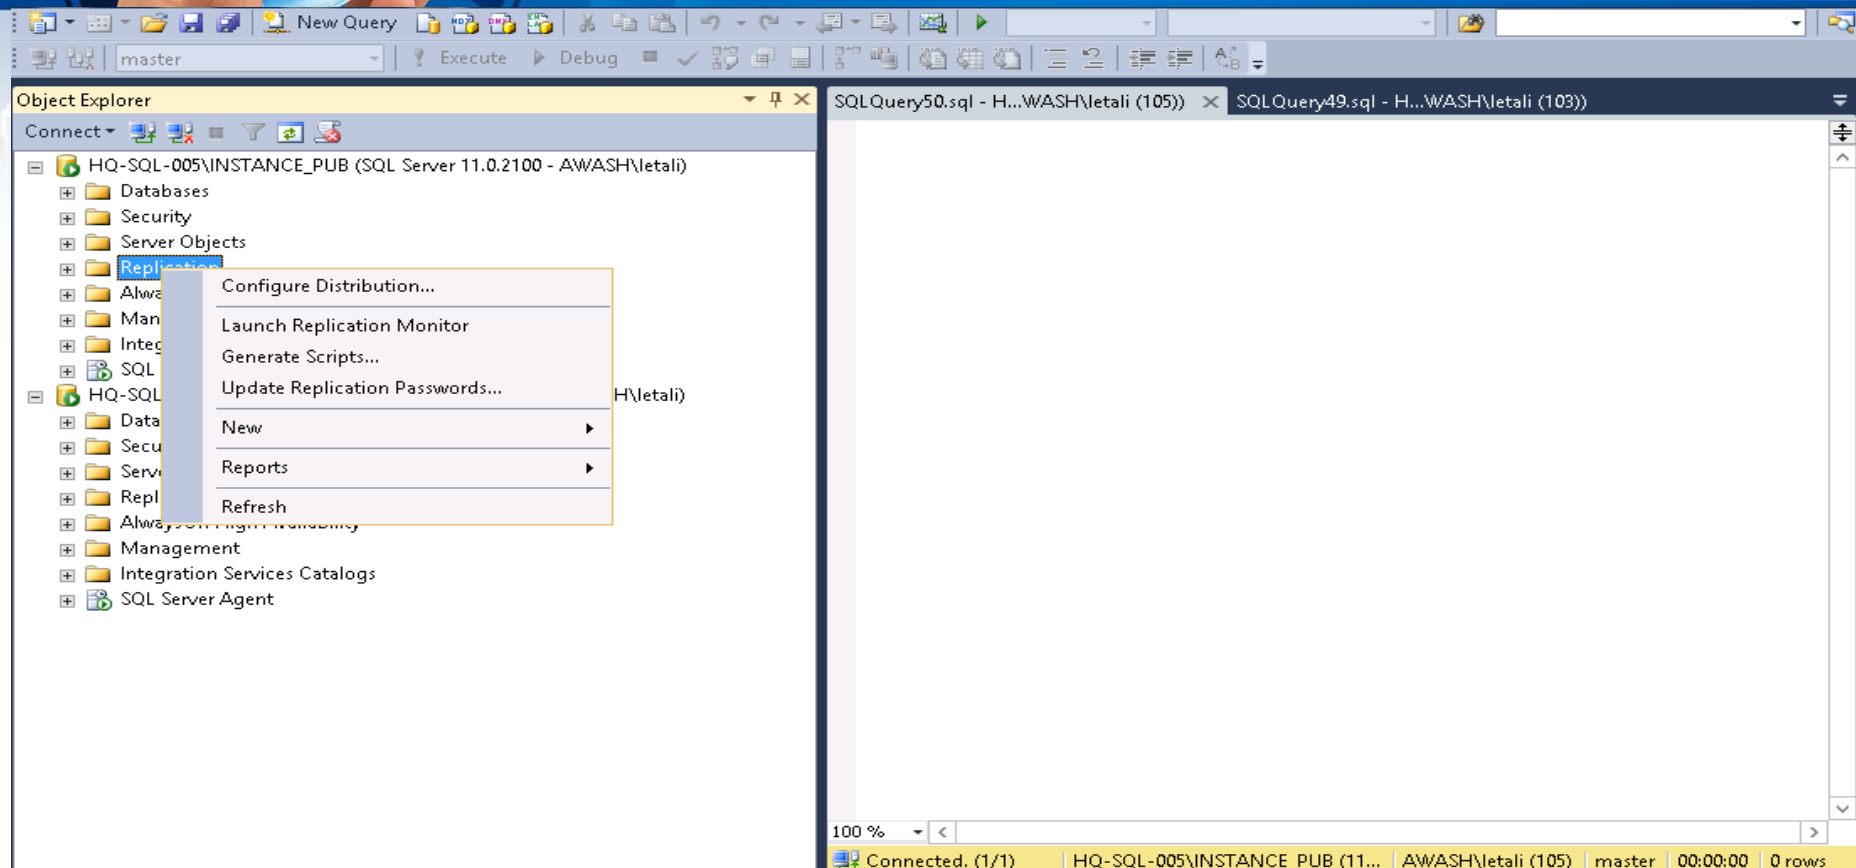

Peer-to-Peer Transactional Replication

- P2P replication is built on transactional replication.
- It maintains transactional replication between servers and allows publishers and subscribers to send data to each other

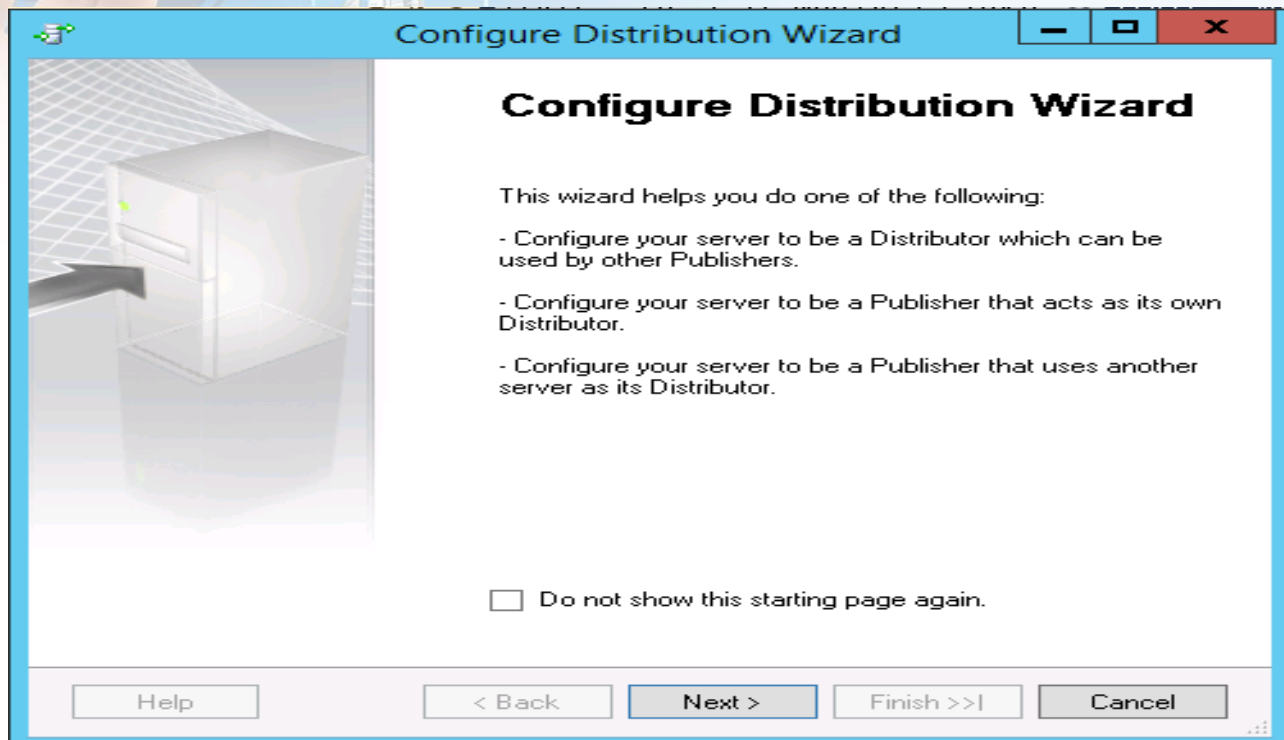

How to configure P2P transactional replication In SQL Management Studio 2012?

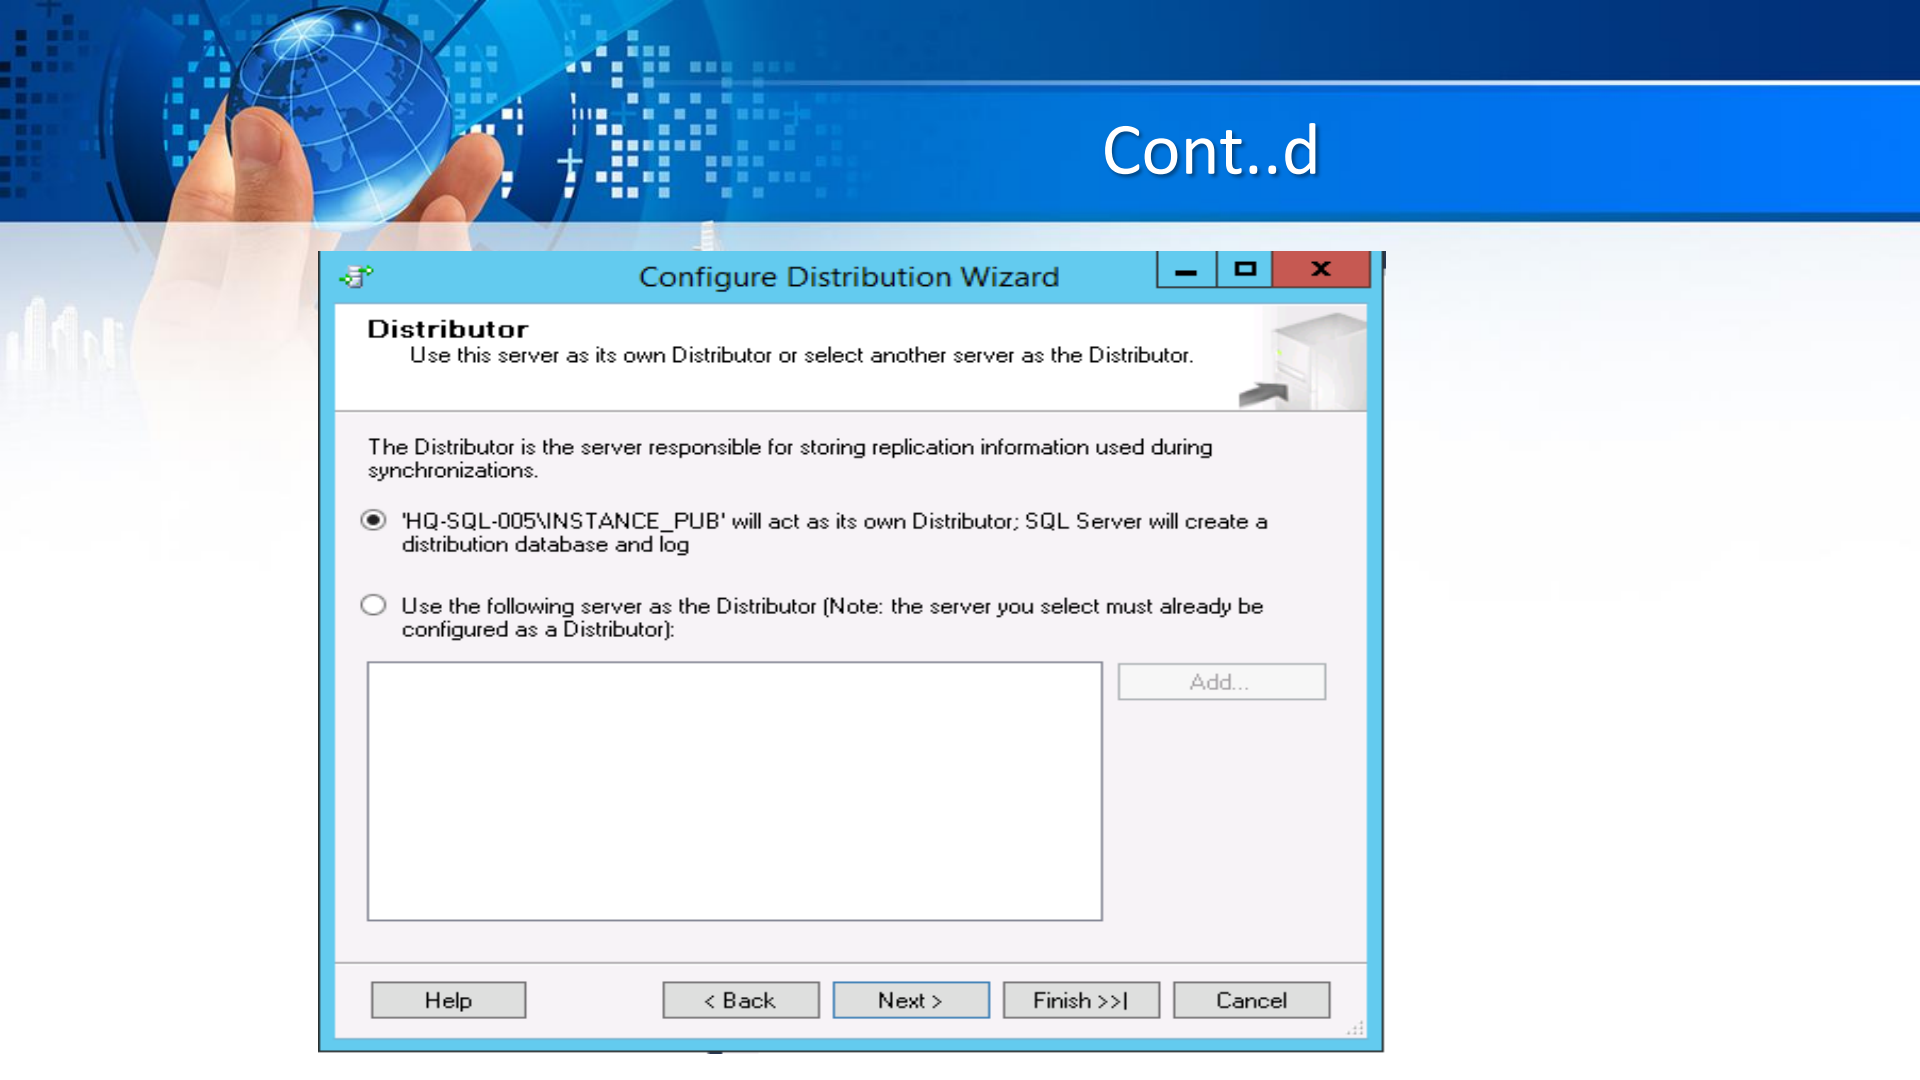

1. Configuring Distributor

Cont..d

Cont..d

Configure Distribution Wizard

Distributor
Use this server as its own Distributor or select another server as the Distributor.

The Distributor is the server responsible for storing replication information used during synchronizations.

☒ 'HQ-SQL-005\INSTANCE_PUB' will act as its own Distributor; SQL Server will create a distribution database and log

☐ Use the following server as the Distributor (Note: the server you select must already be configured as a Distributor):

Add...

Help < Back Next > Finish >>| Cancel

Cont..d

Configure Distribution Wizard

Snapshot Folder
Specify the root location where snapshots will be stored.

To allow Distribution and Merge Agents that run at Subscribers to access the snapshots of their publications, you must use a network path to refer to the snapshot folder.

Snapshot folder:

 Be sure that the path you specify is correct. The wizard cannot validate it because the accounts used to access the folder are not yet known.

Cont..d

Configure Distribution Wizard

Distribution Database
Select the name and location of the distribution database and log files.

The distribution database stores changes to transactional publications until Subscribers can be updated. It also stores historical information for snapshot and merge publications.

Distribution database name:

Folder for the distribution database file:

Folder for the distribution database log file:

The paths must refer to disks that are local to the Distributor and begin with a local drive letter and colon (for example, C:). Mapped drive letters and network paths are invalid.

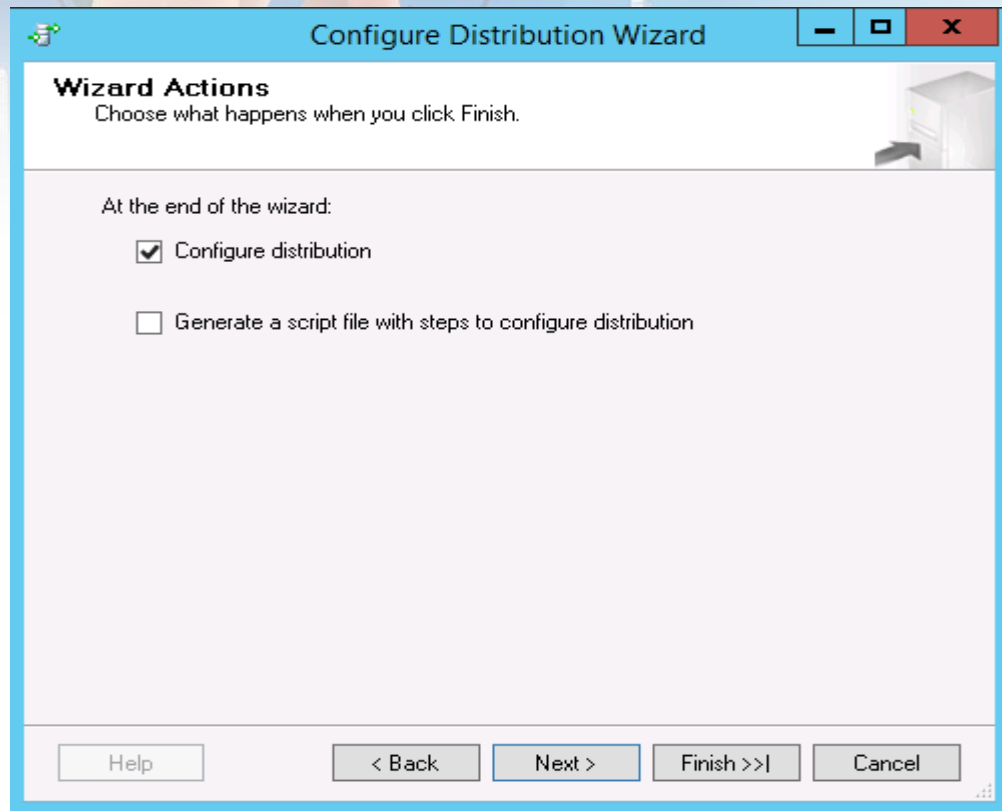

Cont..d

The screenshot shows the 'Configure Distribution Wizard' window, specifically the 'Publishers' step. The window has a blue title bar with the text 'Configure Distribution Wizard' and standard Windows window controls. Below the title bar, the section is titled 'Publishers' with the instruction 'Enable servers to use this Distributor when they become Publishers.' To the right of this text is a small icon of a server rack. The main area contains a table with the following data:

	Publisher ▲	Distribution Database	
<input checked="" type="checkbox"/>	HQ-SQL-005\INSTANCE_PUB	distribution	...

Below the table is an 'Add' button with a dropdown arrow. At the bottom of the window are five buttons: 'Help', '< Back', 'Next >', 'Finish >>I', and 'Cancel'.

2. Configuring Publisher

Cont...d

Cont...d

Cont...d

New Publication Wizard

Publication Type
Choose the publication type that best supports the requirements of your application.

Publication type:

- Snapshot publication
- Transactional publication
- Peer-to-Peer publication**
- Merge publication

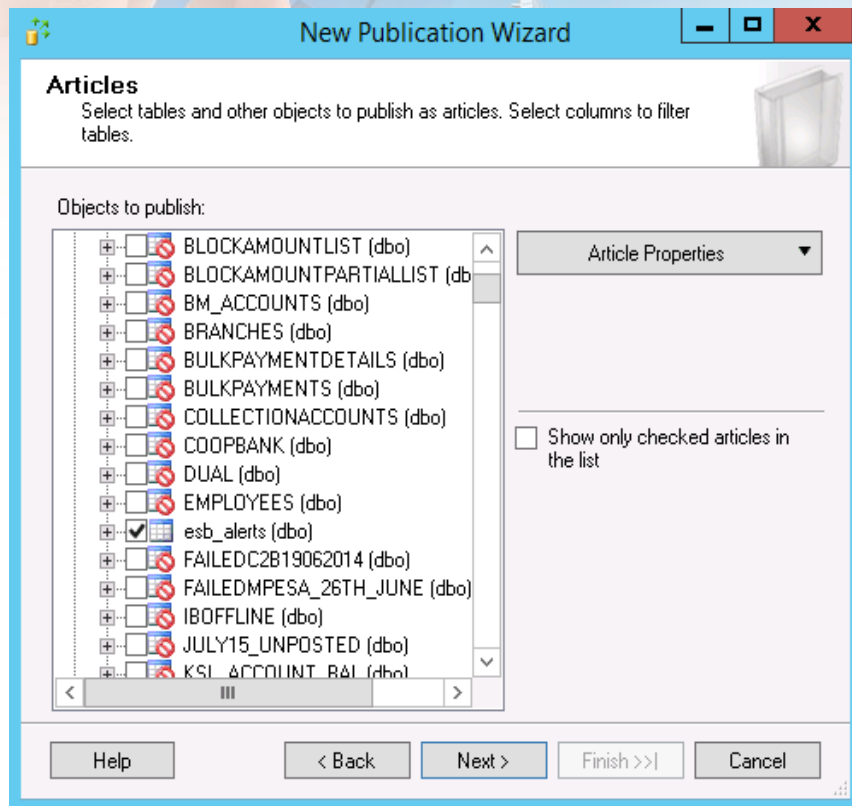

Publication type descriptions:

Peer-to-Peer publication:
Peer-Peer publication enables multi-master replication. The publisher streams transactions to all the peers in the topology. All peer nodes can read and write changes and the changes are propagated to all the nodes in the topology.

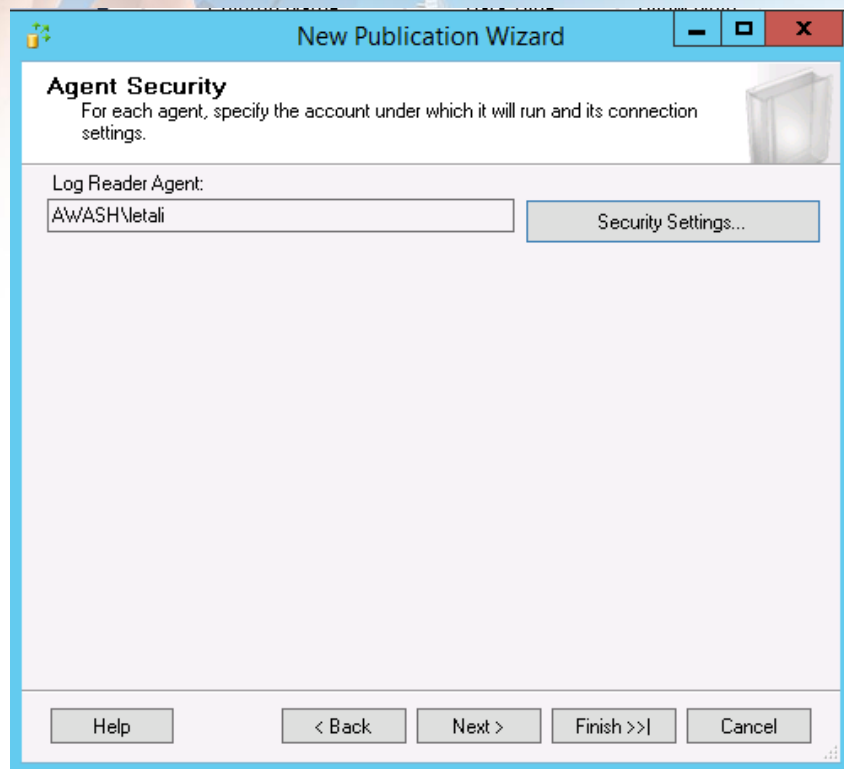

Merge publication:
The Publisher and Subscribers can update the published data independently after the Subscribers receive an initial snapshot of the published data. Changes are merged periodically. Microsoft SQL Server Compact Edition can only subscribe to merge publications.

The image shows a screenshot of a Windows application window titled "New Publication Wizard". The window has a blue title bar with standard minimize, maximize, and close buttons. The main content area is titled "Agent Security" and contains the instruction: "For each agent, specify the account under which it will run and its connection settings." Below this, there is a label "Log Reader Agent:" followed by a text input field containing the text "AWASH\etali". To the right of the input field is a button labeled "Security Settings...". At the bottom of the window, there is a row of five buttons: "Help", "< Back", "Next >", "Finish >>", and "Cancel". The background of the slide features a hand holding a glowing blue globe with a grid pattern, set against a blue gradient with digital patterns.

New Publication Wizard

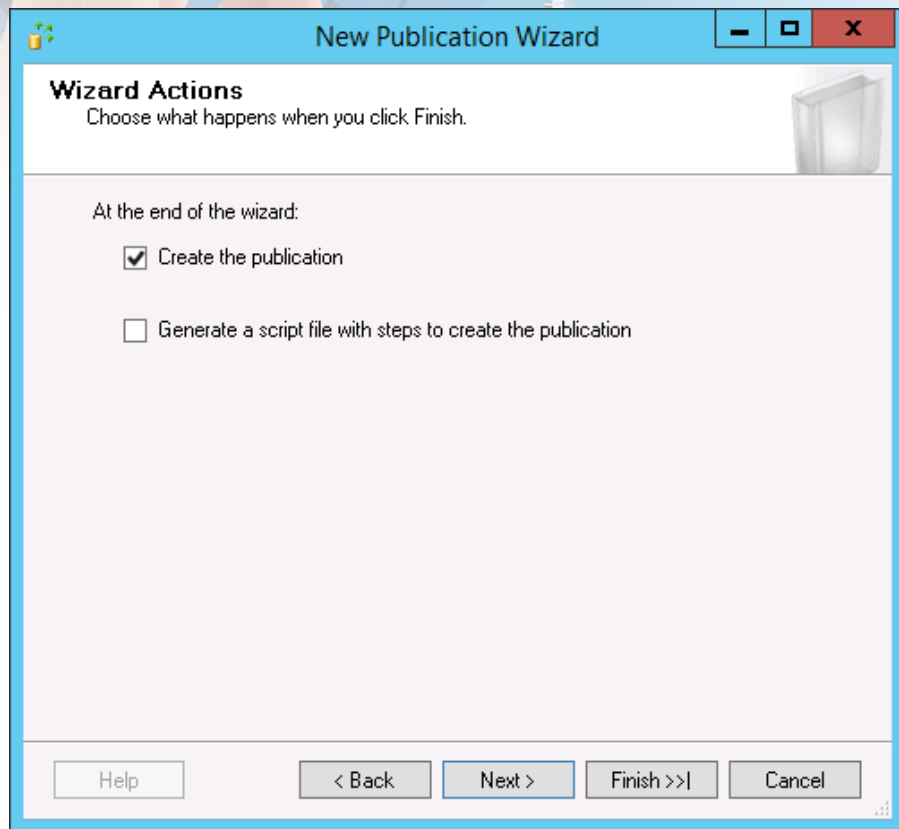

Agent Security
For each agent, specify the account under which it will run and its connection settings.

Log Reader Agent:
AWASH\etali

Security Settings...

Cont...d

The image shows a Windows-style dialog box titled "New Publication Wizard". The title bar includes a standard icon on the left and minimize, maximize, and close buttons on the right. The main content area is divided into two sections. The top section, titled "Wizard Actions", contains the instruction "Choose what happens when you click Finish." and a small icon of a document. The bottom section, titled "At the end of the wizard:", contains two options: "Create the publication" (which is selected with a checked checkbox) and "Generate a script file with steps to create the publication" (which is unselected). At the bottom of the dialog, there are five buttons: "Help", "< Back", "Next >", "Finish >>|", and "Cancel".

New Publication Wizard

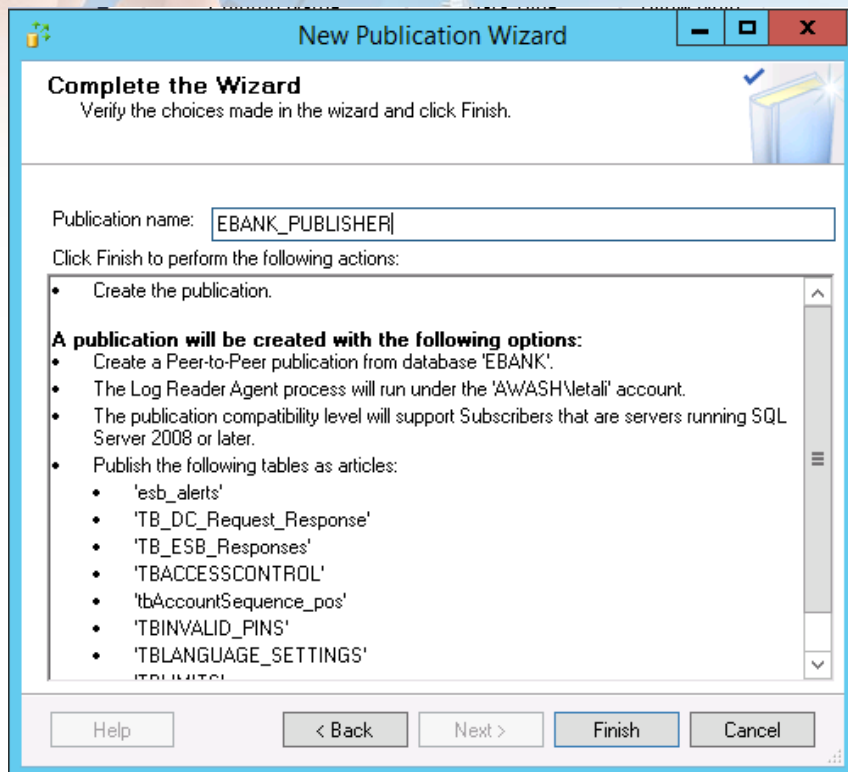

Wizard Actions
Choose what happens when you click Finish.

At the end of the wizard:

- ☒ Create the publication
- ☐ Generate a script file with steps to create the publication

Help < Back Next > Finish >>| Cancel

Cont...d

The image shows a 'New Publication Wizard' dialog box with a blue title bar. The main area is titled 'Complete the Wizard' and contains instructions to verify choices and click Finish. A text box for 'Publication name' contains 'EBANK_PUBLISHER'. Below this, a list of actions to be performed on clicking Finish is shown, including creating the publication and publishing specific tables as articles. The list of tables includes 'esb_alerts', 'TB_DC_Request_Response', 'TB_ESB_Responses', 'TBACCESSCONTROL', 'tbAccountSequence_pos', 'TBINVALID_PINS', and 'TBLANGUAGE_SETTINGS'. At the bottom are buttons for Help, Back, Next, Finish, and Cancel.

New Publication Wizard

Complete the Wizard
Verify the choices made in the wizard and click Finish.

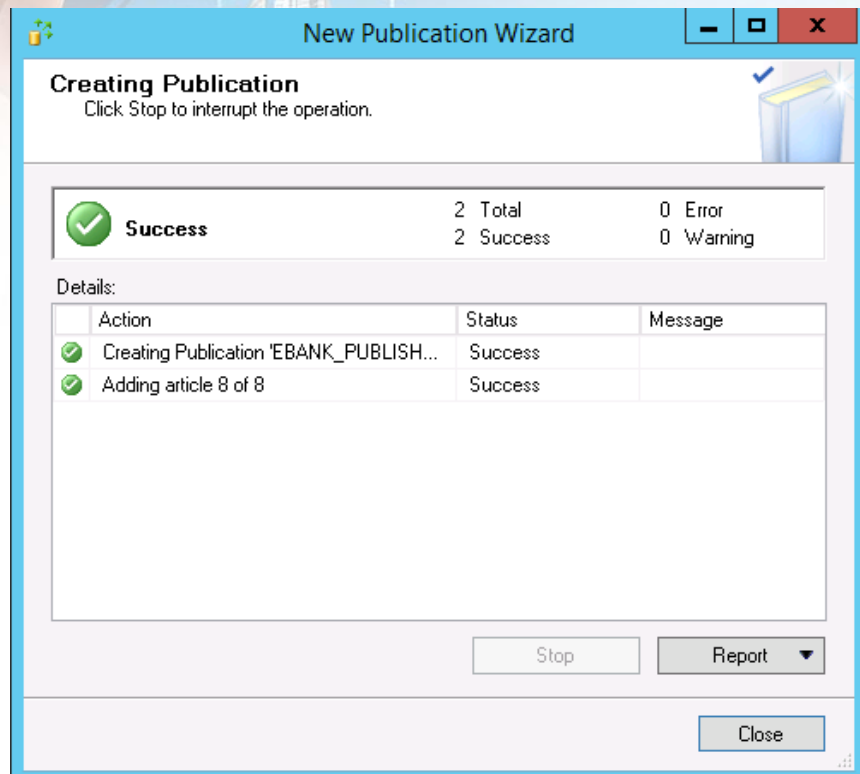

Publication name:

Click Finish to perform the following actions:

- Create the publication.
- A publication will be created with the following options:**
 - Create a Peer-to-Peer publication from database 'EBANK'.
 - The Log Reader Agent process will run under the 'AWASH\Metal' account.
 - The publication compatibility level will support Subscribers that are servers running SQL Server 2008 or later.
 - Publish the following tables as articles:
 - 'esb_alerts'
 - 'TB_DC_Request_Response'
 - 'TB_ESB_Responses'
 - 'TBACCESSCONTROL'
 - 'tbAccountSequence_pos'
 - 'TBINVALID_PINS'
 - 'TBLANGUAGE_SETTINGS'

Buttons: Help, < Back, Next >, Finish, Cancel

Configuring P2P Topology

Creation and Synchronization	
Independent Distribution Agent	True
Snapshot always available	True
Allow anonymous subscriptions	True
Attachable subscription database	False
Allow pull subscriptions	True
Allow initialization from backup files	False
Allow non-SQL Server Subscribers	False
Data Transformation	
Allow data transformations	False
Peer-to-Peer Replication	
Allow peer-to-peer subscriptions	True
Allow peer-to-peer conflict detection	True
Peer originator id	1
Continue replication after conflict detection	False
Schema Replication	
Replicate schema changes	True
Updatable subscriptions	
Allow immediate updating subscriptions	False
Allow queued updating subscriptions	False

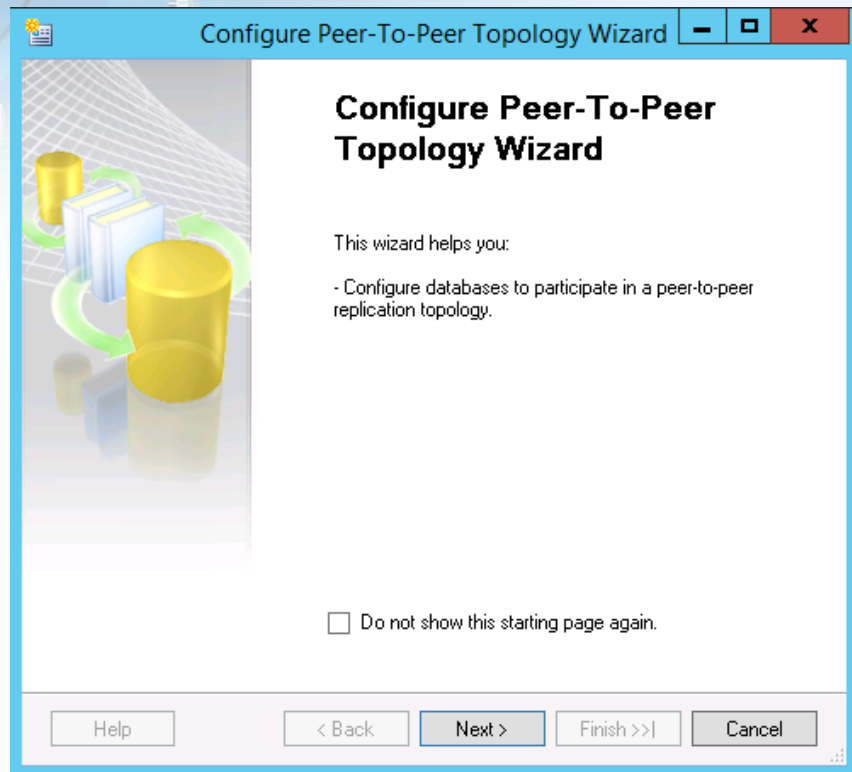

Allow peer-to-peer subscriptions
Determines whether Subscribers can participate in a peer-to-peer relationship with the Publisher.

 After it is set to True, the Allow peer-to-peer subscriptions property cannot be reset to False. Changing this property will cause other publication and article properties to be changed to

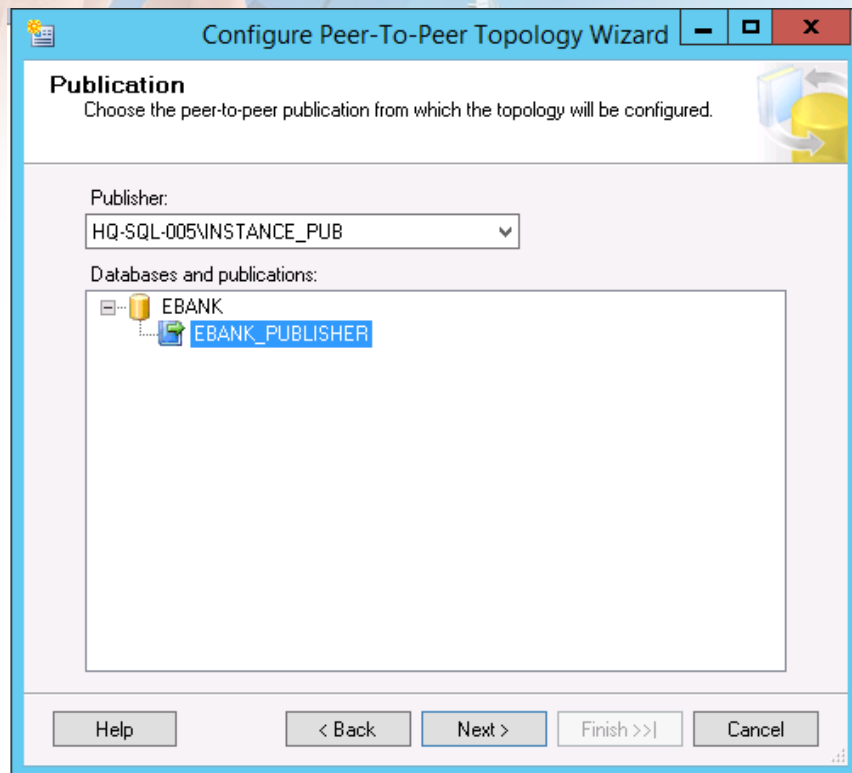

OK

Cancel

Configure Peer-To-Peer Topology Wizard

Log Reader Agent Security
Specify the process account and connection options for each Log Reader Agent that will be created.

Agent security properties:

Agents for Publis...	Peer Database	Connection to Di...	Connection to Pu...
HQ-SQL-003\IN...	EBANK	Impersonate 'A...	Impersonate 'A...

☐ Use the first peer's security settings for all other peers.

Help < Back Next > Finish >> Cancel

Cont..d

Configure Peer-To-Peer Topology Wizard

Distribution Agent Security
Specify the process account and connection options for each Distribution Agent.

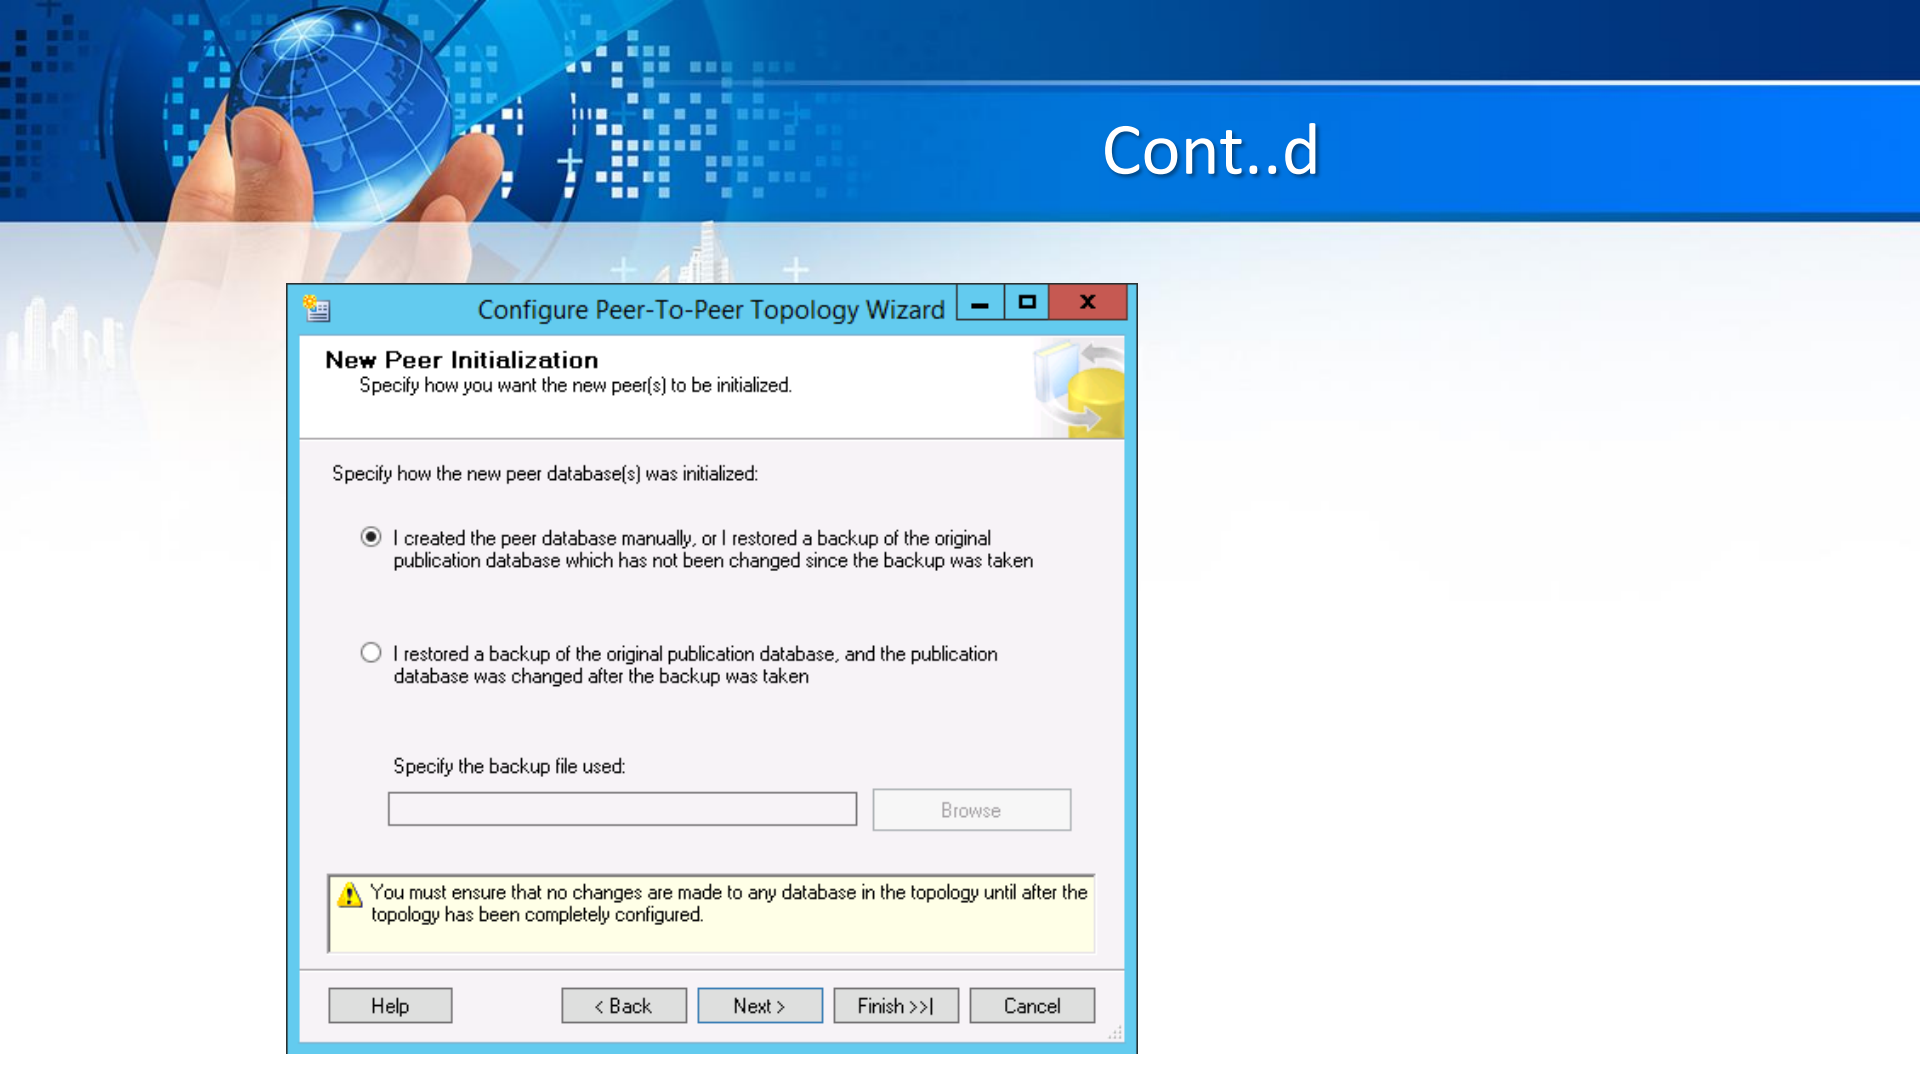

Agent security properties:

Agent for Subscr...	Peer Database	Connection to Di...	Connection to Su...	
HQ-SQL-005\IN...	EBANK	Impersonate 'A...	Impersonate 'A...	...
HQ-SQL-003\IN...	EBANK	Impersonate 'A...	Impersonate 'A...	...

☐ Use the first peer's security settings for all other peers.

Help < Back Next > Finish >>| Cancel

Cont..d

Configure Peer-To-Peer Topology Wizard

New Peer Initialization
Specify how you want the new peer(s) to be initialized.

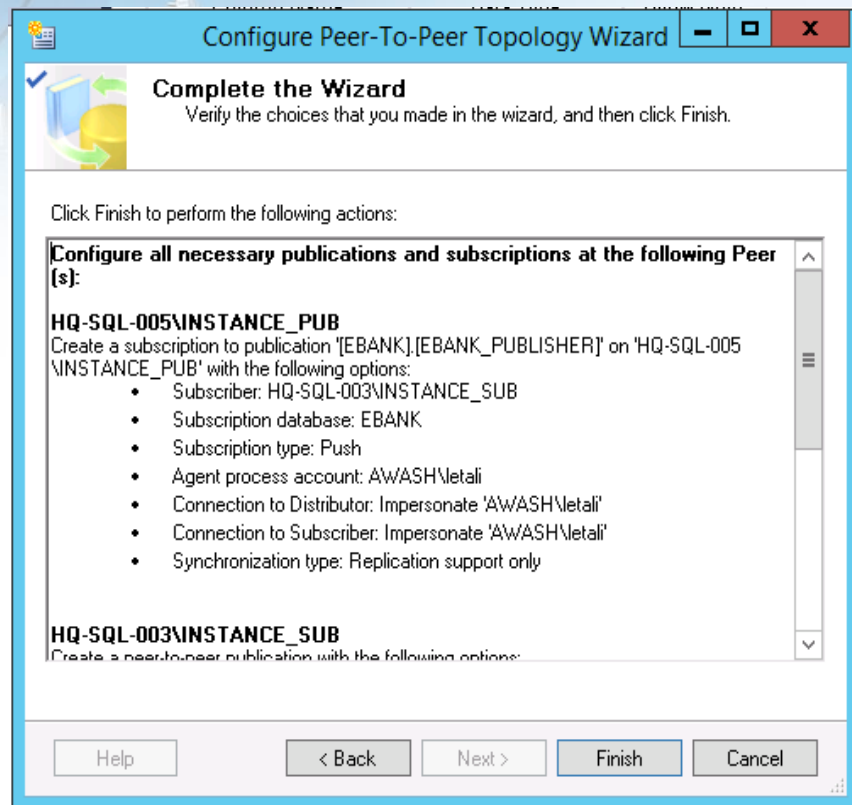

Specify how the new peer database(s) was initialized:

- ☒ I created the peer database manually, or I restored a backup of the original publication database which has not been changed since the backup was taken
- ☐ I restored a backup of the original publication database, and the publication database was changed after the backup was taken

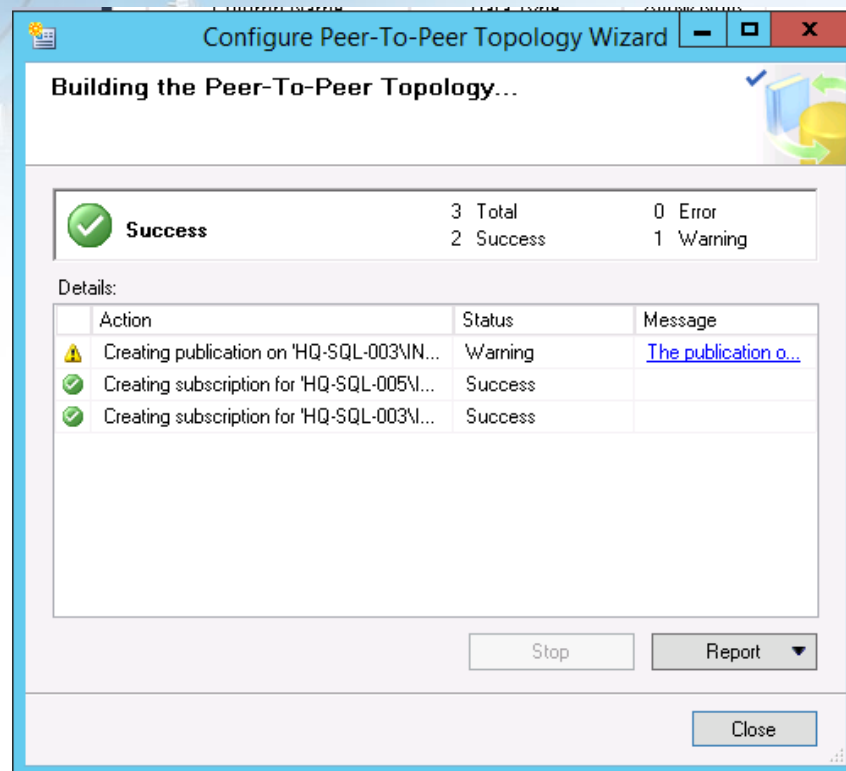

Specify the backup file used:

 You must ensure that no changes are made to any database in the topology until after the topology has been completely configured.
